# Chapter 1

## Main Page

### 1.1 compare to V2:

1. New Interface Layer Add this layer to specify local network interface to open network camera, solving the problem that someone wants to connect to a network camera with ethernet rather than WIFI. Users have to call interface APIs before opening devices.
2. New Image Processing Library The new library which has header file [TYImageProc.h](#) collects all image processing functions we provided.
3. New Coordinate Mapper New [TYCoordinateMapper.h](#) handles various conversions, including depth <-> point3D, point3D <-> point3D.
4. Components: Removed Point3D component(TY\_COMPONENT\_POINT3D). Point3D is a virtual component in V2, and the points are calculated from depth image. We put the calculation outside tycam library to increase flexibility.
5. Features: Removed TY\_BOOL\_TRIGGER\_MODE , covered by TY\_STRUCT\_TRIGGER\_PARAM Added TY\_STRUCT\_CAM\_CALIB\_DATA , for easy use in image processing library TY\_INT\_IMAGE\_MODE , covered by new added TY\_ENUM\_IMAGE\_MODE Modified TY\_ENUM\_IMAGE\_MODE , means resolution mode in V2, combine resolution and pixel format in V3 Added some network camera's feature, such as TY\_INT\_PERSISTENT\_IP, TY\_INT\_PERSISTENT\_SUBMASK, TY\_INT\_PACKET\_DELAY, etc.

### 1.2 Note

Depth camera, called "device", consists of several components. Each component is a hardware module or virtual module, such as RGB sensor, depth sensor. Each component has its own features, such as image width, exposure time, etc..

NOTE: The component TY\_COMPONENT\_DEVICE is a virtual component that contains all features related to the whole device, such as trigger mode, device IP.

Each frame consists of several images. Normally, all the images have identical timestamp, means they are captured at the same time.
